- Pin Assignments
- LED Indicators

Overview

The ioLogik E2212 is a member of the E2000 line of ioLogik Active Ethernet I/O servers, which are designed for intelligent, pro-active status reporting of attached sensors, transmitters, transducers, and valves over a network. It includes 2 MB of Flash ROM, 8 MB of SDRAM, and supports an optional hot-pluggable Liquid Crystal Display Module (LCM) to view and configure device settings.

Traditional Remote I/O

Ethernet remote I/O solutions have been on the market for a long time. Traditional solutions are "passive," in the sense that I/O servers wait passively to be polled by a host computer. The response time in this type of setup, however, tends to be on the order of seconds. The "passive" remote I/O structure is simply inadequate for Data Acquisition and Control (DAC) systems that require an efficient, real-time I/O solution with a response time on the order of hundredths of seconds.

Active Ethernet I/O

Moxa's **Active Ethernet I/O** line was developed specifically to address the limitations of the traditional passive approach. Rather than having the host computer poll the I/O device server over the network for the status of each I/O device, the **Active Ethernet I/O server** intelligently sends the host computer status information only under specified conditions. This is a **report by exception** approach, which greatly reduces the load on CPU and network resources. Network packets are far fewer in number and far smaller in size, since I/O information is only sent when necessary, and only information from the specified I/O device is sent. Based on field tests of an ioLogik E2000 series server used in an RFID system, 50 ms is the typical response time over a 100 Mbps Ethernet network. Moxa's active I/O messaging system uses TCP or UDP for I/O messaging and supports sending messages to up to ten host computers simultaneously.

In addition to providing intelligent status reporting, Active Ethernet I/O servers are backwards compatible, with all of the functions and capabilities of traditional passive remote I/O servers.

Click&Go

Moxa developed the Click&Go logic control interface for easy configuration and deployment of Active Ethernet I/O. Click&Go's intuitive, graphical interface lets administrators use simple IF/THEN statements as rules to determine how the Active Ethernet I/O server responds to different I/O conditions. For example, the Active Ethernet I/O server could be set to turn on an attached switch as well as send an e-mail or SNMP trap when an attached event counter reaches a certain value. Click&Go makes it easy to define a set of these rules, which will become the basis for your Active Ethernet I/O system.

Optional Liquid Crystal Display Module (LCM)

The ioLogik E2212 supports an optional hot-pluggable Liquid Crystal Display Module (LCM) for field management and configuration. The LCM can display network and I/O settings such as digital input mode and value. The ioLogik E2212's IP address and netmask may also be configured using the LCM, and one LCM can be used to maintain and configure multiple ioLogik E2212 servers.

Product Features

Configurable I/O channels

The ioLogik E2212 provides the flexibility to handle almost any field installation, with 8 fixed input channels, 8 fixed output channels, and 4 configurable input/output channels. This enables you to define custom configurations such as 12 inputs and 8 outputs, 8 inputs and 12 outputs, or 10 inputs and 10 outputs.

Accepts PNP or NPN sensors

Unlike traditional Ethernet I/O products, the ioLogik E2212 supports dry contact, PNP, and NPN sensors. The sensor type is determined by your wiring approach. Sensors can be wired in two different groups, so both PNP and NPN sensors can be connected to the unit at the same time.

Patented Click&Go logic for easy local control without programming

On Active Ethernet I/O servers, Moxa's Click&Go logic makes it easy to define a set of rules for local control of attached output devices. For example, you can define a rule that activates an attached switch and sends an e-mail when a sensor event occurs a certain number of times.

Instant event reporting by TCP, UDP, e-mail, or SNMP trap

Active Ethernet I/O servers can report I/O events automatically to any network host. Reports are fully customizable and can be sent by TCP, UDP, e-mail, or SNMP trap.

Peer-to-peer I/O for transmission of sensor signals over Ethernet without controller

The ioLogik E2212 supports Peer-to-Peer I/O operation, where sensor signals are transmitted over Ethernet to another ioLogik E2212. For typical 100 Mbps LANs, latency is only 100 ms.

Power fail counter storage memory

The ioLogik E2212 stores event counter values so that they are not lost during a power failure or disconnection.

RoHS compliance

As required by EU regulations, the ioLogik E2212 is fully RoHS-compliant.

Package List

The ioLogik E2212 is shipped with the following items:

Standard Accessories

- ioLogik E2212 Active Ethernet I/O server
- Documentation and Software CD

Optional Accessories

• LDP1602 ioLogik LCM (Liquid Crystal Display Module)

NOTE: Notify your sales representative if any of the above items are missing or damaged.

Product Specifications

LAN

Interface 10/100BaseTx with MDI/MDIX, RJ45

Protocols Modbus/TCP, TCP/IP, UDP, DHCP, Bootp, SNMP(MIB for

I/O and Network), HTTP, SNTP

Protection 1.5KV magnetic isolation IP Address Fixed, dynamic (DHCP)

Default: 192.168.127.254

Serial

Interface RS-485 (2 wire): Data+, Data-, GND

Serial Line Protection 15 KV ESD for all signals

Serial Communication Parameters

Parity None
Data Bits 8
Stop Bits 1
Flow Control None

Speed 1200 to 115200 bps Protocol Modbus/RTU

Digital Input

Inputs 8 fixed points, two 6-point groups for sink/source type

I/O Mode DI or event counter (up to 900 Hz)
DI COM Power Input 24 VDC nominal, up to 36 VDC

Dry Contact Logic 0: short to GND

Logic 1:open

Wet Contact Logic 0: 0 to 3 VDC

Logic 1: 10 to 30 VDC(DI COM to DI)

Common Type 6 points /1 COM
Isolation 3000 VDC / 2000 Vrms

Protection Over voltage protection: +36 VDC

Counter Power Off Storage Yes

Digital Output

Inputs 8 fixed points sink type

I/O Mode

DO or pulse output (up to 100 Hz)

DO Power Input

24 VDC nominal, up to 30V

Output Current Rating

Max. 200 mA per channel

Magnetic Isolation

3000 VDC / 2000 Vrms

Protection Over voltage protection: +36 VDC
Over current limit: 600 mA (typical)
Over temperature shutdown: 160°C (min.)

Configurable DI/DO Channels

Channels

I/O mode DI or event counter (up to 900 Hz)
DO or pulse output (up to 100 Hz)

Magnetic Isolation 3000 VDC/ 2000 Vrms

System Power Input

Power Input 24 VDC nominal, 12VDC (min.) to 48 VDC (max.)

Power Consumption 7.5W @24 VCD

Ground Connection DIN-rail or panel mounting sockets

Environmental

Operation Temperature -10 to 60°C (14 to 140°F), 5 to 95% RH Storage Temperature -40 to 85°C (-40 to 185°F), 50 to 95% RH

Wiring

I/O Cable Max. 14 AWG

Certifications Shock, Freefall, Vibration,

CE Class A, Level 3,

FCC Part 15, CISPR (EN55022) Class A

With LCM

Hardware Reference

Panel Guide

NOTE: The reset button restarts the server and resets all settings to factory defaults. Use a pointed object such as a straightened paper clip to hold the reset button down for 5 sec. The RDY LED will turn red as you are holding the reset button down. The factory defaults will be loaded once the RDY LED turns green again. You may then release the reset button.

This chapter describes how to install the ioLogik E2212 Active Ethernet I/O Server.

The following topics are covered in this chapter:

□ Hardware Installation

- ➤ Connecting the Power
- Grounding the Unit
- Connecting to the Network
- ➤ Adding More I/O Channels
- > Setting the RS-485 Baudrate
- ➤ Connecting the I/O Device
- **□** Software Installation

Hardware Installation

Connecting the Power

Connect the 12 to 48 VDC power line to the ioLogik's terminal block (TB1). If power is properly supplied, the power LED will glow a solid red color until the system is ready

ATTENTION

Disconnect the power before installing and wiring!

Disconnect the power cord before installing and/or wiring your ioLogik.

Do not exceed the maximum current for the wiring!

Determine the maximum possible current for each power wire and common wire. Observe all electrical codes dictating the maximum current allowable for each wire size.

If the current exceeds the maximum rating, the wiring could overheat, causing serious damage to your equipment.

Grounding the Unit

The ioLogik is equipped with two grounding points, one on the wall mount socket and the other on the DIN-rail mount. Both grounding points are connected to the same conducting pathway.

Connecting to the Network

- 1. Connect the ioLogik to the host PC with an Ethernet cable. For initial configuration, it is recommended that the ioLogik E2212 be configured using a direct connection to a host computer rather than remotely over the network.
- 2. Set the host PC's IP address to 192.168.127.xxx. (xxx: from 001 to 253). In Windows, you may set this through the Control Panel.

| Default IP Address | Default Netmask | Default Gateway |
|--------------------|-----------------|------------------------|
| 192.168.127.254 | 255.255.255.0 | None |

3. Use ioAdmin or the web console to detect the ioLogik. Once the ioLogik has been detected, modify the settings as needed for your network environment, then restart the server.

Adding More I/O Channels

A cost effective way to add more I/O channels to your ioLogik E2000 I/O server is to attach the appropriate ioLogik R2000 I/O server. The two servers can be snapped together using the RS-485 system bus connector, as shown in the following figure. For the ioLogik E2212, additional digital I/O channels are added using the ioLogik R2110. For additional details, please refer to the ioLogik R2110 user's manual.

Setting the RS-485 Baudrate

The RS-485 port on the ioLogik E2212 is reserved to chain another RS-485 I/O server. The RS-485 port can run Modbus/RTU or I/O command sets. The baudrate is set by a physical dial on the back of the ioLogik. The default settings are baudrate = 115200, parity check = N, data bits = 8, and stop bit = 1. Modbus/RTU only supports N, 8, 1, so E, 7, 1 is not supported. When using the RS-485 cascading interface, the ioLogik E2212 will have an RS-485 Unit ID of 1.

| Ba Ba | | Dial setting a | nd correspond | ding baudrate | |
|-------|------------------------|----------------|---------------|---------------|---------|
| (pa | arameters are N, 8, 1) | 0:115200 | 1:57600 | 2:38400 | 3:19200 |
| 206 | | 4:9600 | 5:4800 | 6:2400 | 7:1200 |

Remember to restart the ioLogik E2212 after making any changes to the RS-485 baud rate.

Connecting the I/O Device

With 4 channels that are configurable for digital input or digital output operation, the ioLogik E2212 offers great flexibility in connecting I/O devices. Also, unlike traditional Ethernet I/O products, the ioLogik E2212 can connect to dry contact, PNP, and NPN sensors at the same time. The sensor type determines your wiring approach, as shown in the following examples:

ATTENTION

Sensor types are set in groups, with DI-0 to DI-5 forming one group and DI-6- to DI-11 forming another group (assuming that channels 8 through 11 are configured as digital input channels). If an NPN sensor is connected to DI-0, then only NPN sensors can be connected to the other DI channels in the group (i.e., DI-1 through DI-5). Likewise, if a PNP sensor is connected to DI-6, then only PNP sensors can be connected to the other DI channels in the group (i.e., DI-7 through DI-11).

Software Installation

ioAdmin is a Windows utility provided for the configuration and management of the ioLogik E2212 and attached I/O devices. It may be used from anywhere on the network to monitor and configure the ioLogik E2212. You may also configure some of the settings through the web console or optional LCM.

- 1. **Installation from CD**: Insert the Document and Software CD into the host computer. In the root directory of the CD, locate and run SETUP.EXE. The installation program will guide you through the installation process and install the ioAdmin utility. You can also install the MXIO DLL library or ioEventLog separately.
- 2. **Open ioAdmin**: After installation is finished, run ioAdmin from the Windows Start menu: Start → Program Files → Moxa → IO Server → Utility → ioAdmin.
- Search the network for the server: On the menu bar, select System → Auto Scan Active
 Ethernet I/O Server. A dialog window will appear. Click Start Search to begin searching for your unit.

If ioAdmin is unable to find your unit, there may be a problem with your network settings.

Connecting Multiple ioLogik E2000 Units

If multiple ioLogik E2000 units are installed on the same network, remember that each unit has the same default IP address. You will need to assign a different IP address to each unit to avoid IP conflicts. ioAdmin automatically detects IP conflicts and gives you a chance to modify each unit's IP address in the "IP Address" columns. Click the "Set" button to reboot the corresponding unit with its new IP address. Click the "Re-Search" button to refresh the list of units found by ioAdmin.

4. **Monitoring I/O status**: Once your unit has been found by ioAdmin, you may view the status of all attached I/O devices on ioAdmin's main screen.

You may now use ioAdmin to setup or configure your unit. Please refer to Chapter 3 for additional information on using ioAdmin.

Using ioAdmin

In this chapter, we explain how to use ioAdmin to configure your ioLogik.

The following topics are covered in this chapter:

☐ Using ioEventLog

Introduction to ioAdmin

ioLogik Ethernet I/O Servers may be managed and configured over the Ethernet with ioAdmin, a Windows utility provided with your ioLogik E2212. ioAdmin's graphical-user interface gives you easy access to all status information and settings.

The ioLogik E2212 also supports configuration by web console and by optional LCM, but full configuration and management is only available through ioAdmin.

A new feature in ioAdmin automatically detects IP conflicts between ioLogik E2000 units. If ioAdmin detects an IP conflict, a window will appear that allows you to resolve the IP conflict immediately and restart each unit.

ioAdmin also includes Click&Go logic control for the configuration of your Active Ethernet I/O system.

ioAdmin consists of following software:

- ioAdmin with Click&Go Logic
- ioLogik 2000 Wiring Guide
- ioLogik 4000 Wiring Guide

Features of ioAdmin

Remote management

Over the Ethernet network, ioAdmin allows users to

- find and configure multiple ioLogik servers.
- monitor and configure attached I/O devices.
- test I/O devices.
- reset the server.

| Part |

On-line Wiring Guide

A wiring guide can be opened from within ioAdmin for your convenience. The easily accessible wiring guide can save administrators much time while planning or troubleshooting.

Configuration File

ioAdmin allows the entire configuration of the ioLogik E2212 to be saved as a file. The file is viewable as text and can serve three purposes:

- as a record or backup of configuration
- as a template for the configuration of other servers
- as a quick reference guide for you to configure Modbus drivers in a SCADA system

The file includes the following information:

- file title, date, and time
- model information
- Modbus address

Server Management List

ioAdmin can import and export a list of ioLogik servers that are being managed. This file can make it easier to manage all devices on the network, and includes the following information:

- server name
- module type
- IP address
- unit ID

```

ioAdmin Main Screen

Main Screen Overview

This is ioAdmin's main screen. The main window defaults to the I/O Configuration tab, which displays a figure of your unit with the status of every I/O channel. The other tabs in the main window take you to server and network settings, and further functions are available when you log on as an administrator. Note that configuration options are not available until you log on as an administrator.

| ioAdmin Main Screen | | |
|---------------------|-------------------|--|
| 1. | Title | |
| 2. | Menu bar | |
| 3. | Quick link | |
| 4. | Navigation panel | |
| 5. | Main window | |
| 6. | Sync. rate status | |
| 7. | Status bar | |

Wiring Guide

ioAdmin provides a wiring guide for the ioLogik E2212. You may access the wiring guide by right-clicking the ioLogik figure in the I/O Configuration tab. Select "Wiring Guide" in the submenu to open a help file showing the unit's wiring information and electrical characteristics.

You may also access the On-line Wiring Guide through the Help menu on the menu bar.

Menu Items

File

From the **File** menu, you can export the list of I/O servers that are currently displayed in the navigation panel. You also can import a list of I/O servers into ioAdmin.

When importing a server list, you will be prompted to select which servers on the list need to be imported.

The file will have an .SLT extension and can be opened as a text file. The server list will provide the following information for each server:

- server name
- module type
- IP address
- unit ID

System

Several operations are possible from the ${\bf System}$ menu.

Auto Scan Active Ethernet I/O Server will search for ioLogik servers on the network. When connecting for the first time or recovering from a network disconnection, you can use this command to find I/O servers that are on the network.

Network Interface allows you to select a network to use, if the PC has multiple network adapters installed.

I/O Status Refresh Rate is used to adjust how often the I/O server is polled for device status. The current rate is displayed on the status bar at the bottom of the window. Note that higher sync rates result in higher loads on the network.

TCP Socket Timeout Interval allows you to select the preferred timeout value for TCP socket communication.

COM Port Setting is used to set the parameters for Modbus communciation, such as baudrate, data bits, and timeout interval. For most applications, this will involve connecting to ioLogik R-Series devices.

Active Message Listen Port specifies the port number to use for Active Ethernet I/O messages. If your network uses a firewall, you can coordinate this setting with your firewall settings to ensure that active messages get through.

Reset NA4010 Network Adapter IP is used to re-assign an IP address to the NA-4010 network adapter, for ioLogik 4000 systems.

Sort

The **Sort** menu allows the server list in the navigation panel to be sorted by connection, type, and location.

Help

In the Help menu, you can view wiring guides and information about ioAdmin.

Quick Links

Quick links are provided to search for I/O servers on the network and sort the server list.

Main Window

I/O Configuration Tab (General)

The **I/O Configuration** tab shows the status of every I/O channel. This is the default tab when you first open ioAdmin. DI channels are listed on the left and DO channels are listed on the right. The four selectable channels will be listed on the left or the right according to the selected mode.

Server Info Tab

Server information, such as firmware version, is displayed in the Server Info tab.

Server Settings Tab (General)

The **Server Settings** tab is where you log in as an administrator. This is required in order to gain access to the ioLogik E2212 configuration options. If no administrator password has been set up, simply click **Login** and leave the **Password** for entry field blank. Please refer to the ioAdmin Administrator Functions section later on in this chapter for more detail.

Message Monitor Tab

The **Message Monitor** tab will display any TCP/UDP messages received from the ioLogik E2212. When you install the unit for the first time, the ruleset will not have been defined yet, so there will be no messages in the Message Monitor Tab. When a ruleset has been defined and activated, any TCP/UDP messages that have been triggered by sensor events will be shown in the Message Monitor tab. Please refer to Chapter 5 for information on how to define rules for active I/O messaging.

Messages can be displayed in ASCII or in HEX. To display messages in HEX, make sure that "Toggle HEX" is checked.

ioAdmin Administrator Functions

For full access to all configuration options, log in as an administrator in the Server Settings tab. This is required whenever you start up ioAdmin or boot up/restart the ioLogik. When you install the ioLogik E2212 for the first time, the password will be blank and you may simply click **Login**. Additional functions will available after logging in, including the following new tabs:

When making configuration changes, you will need to click **Update** or **Apply** to save the changes. Some changes will require that the unit be restarted in order to take effect.

ATTENTION

You MUST log in to access any administrator function, including Network, Communication Watchdog Timer, and Firmware Update tabs. If you forget the password, you may hold down the reset button to clear the password and load factory defaults. This will result in the loss of all configuration settings and your Click&Go Logic active I/O messaging program!

I/O Configuration Tab (Administrator)

When logged on as an administrator, you may double click on a channel in the **I/O Configuration** tab to configure that channel's settings. A window will open with configuration options for that channel. After the channel has been configured as desired, click **Apply** to implement the new settings.

Configuring Digital Input Channels

The ioLogik E2212 provides up to 12 digital input (DI) channels, with 8 fixed DI channels (DI-0 to DI-7) and 4 channels that can be configured as DI or DO channels (DIO-8 to DIO-11). Software filtering is used to control switch bounces. The filter is configurable in multiples of 0.5 ms and accepts values between 1 and 65535. For example, a setting of $\bf 2$ would mean a 1 ms filter (2×0.5 ms).

A DI channel can be set to "DI" or "Event Counter" mode. In DI mode, the specifications are as follows:

| Type | Logic 0 (OFF) | Logic 1 (ON) |
|-------------|---------------|--------------|
| Dry contact | close to GND | open |
| Wet contact | 0 to 3 V | 10 to 30 V |

In Event Counter mode, the channel accepts limit or proximity switches and counts events according to the ON/OFF status. When "Lo to Hi" is selected, the counter value increases when the attached switch is pushed. When "Hi to Lo" is selected, the counter value increases when the switch is pushed and released.

By default, the Event Counter value will be reset to zero if power is disconnected. If you select **Save status on power failure**, the Event Counter value will be saved when power is disconnected. When power is reconnected, the value will be as you left it. You can set **Power On Settings** to have counting resume immediately.

The Event Counter starts counting events when specified by a Modbus command or a Click&Go Logic rule. You can also specify counting to begin automatically when the ioLogik is powered on. To activate this function, select **Start** under **Counter mode parameter** in the **Power On Settings**.

You can control how an Event Counter channel behaves during a network disconnection with the **Safe Status Settings** and the Host Connection Watchdog. When the Host Connection Watchdog is enabled, a network disconnection will activate the Safe Status Settings. The Event Counter channel can be configured to continue counting by selecting **Start/Continue** under **Counter mode parameter**. If **Start/Continue** is not selected, the Event Counter channel will suspend counting. If the Host Connection Watchdog is not enabled, then the Safe Status Settings will be ignored and the Event Counter channel will continue counting during a network disconnection.

ATTENTION

The Host Connection Watchdog is disabled by default and must be enabled for Safe Status Settings to take effect.

The **Apply to all channels** option applies all settings to DI channels, including DIO channels that are operating as DI channels.

Configuring Digital Output Channels

The ioLogik E2212 provides up to 12 digital output (DO) channels with 8 fixed DO channels (DO-0 to DO-7) and 4 channels that can be configured as DI or DO channels (DIO-8 to DIO-11).

A DO channel can be set to "DO" or "Pulse Output" mode. In DO mode, the specifications are as follows.

| Type | Logic 0 (OFF) | Logic 1 (ON) |
|---------|---------------|--------------|
| DO mode | open | short |

In Pulse Output mode, the selected digital output channel will generate a square wave as specified in the pulse mode parameters. The low and high level widths are specified in multiples of 0.5ms, with a maximum setting of 65,535 (32,767 ms). For example, you would enter 1000 for a width of 500 ms,. If the low width value is 5000 and the high width value is 5000, the pulse output would be a square wave with a 5-second pulse cycle. For the number of pulses, you can specify between 1 and 4,294,967,295 pulses or enter "0" for continuous pulse output.

When the ioLogik is first powered on, the status for each DO channel will be set to "OFF" by default. This behavior can be modified using the **Power On Settings**. You can set a DO channel to turn "ON" when the ioLogik is powered on, or to commence pulse output.

You can control how a DO channel acts when the network is disconnected by using the **Safe Status Settings** and the Host Connection Watchdog. When the Host Connection Watchdog is enabled, a network disconnection will activate the Safe Status Settings. The DO channel can be configured to turn on, turn off, or commence pulse output. If the Host Connection Watchdog is not enabled, then the DO channel status will remain unchanged during a network disconnection.

ATTENTION

The Host Connection Watchdog is disabled by default and must be enabled for Safe Status Settings to take effect.

The **Apply to all channels** option applies all settings to DO channels, including DIO channels that are operating as DO channels.

Configuring Selectable DIO Channels

Channels DIO-8 to DIO-11 support both DI and DO channel operation. When the ioLogik E2212 is powered on, each DIO channel will be configured to act as either a DI or DO channel, according to the **Power On Settings**. When acting as a DI channel, configuration is the same as for fixed DI channels. When acting as a DO channel, configuration is the same as for fixed DO channels.

To switch to between DI and DO channel operation, select the desired mode in the **I/O Direction** field under **Power On Settings**. After clicking **Apply**, you will need to restart the ioLogik E2212 for the new setting to take effect.

Testing DI and DO Channels

You can test each channel by opening the channel's configuration window and selecting the Test tab.

In the Test tab, you can see how a channel's status affects or is affected by the attached device. For DO channels, you can set the on/off status or start and stop pulse output. For DI channels, you can monitor the attached device's on/off status, or count switch press events.

Server Settings Tab (Administrator)

You may set up a password, server name, location, date, time zone, and time server in the Server Settings tab. ioAdmin supports long server names and a location description up to 58 chars. If you will be using ioEventLog to receive server status reports, such as for warm or cold starts, indicate the IP address and port number for the PC that will be running ioEventLog in the "System Log" field. The default port number is 4040.

For additional information, please refer the ioEventLog section later in this chapter.

Network Tab

The **Network** tab is available after you log in as an administrator. You may configure IP settings, Modbus/TCP Alive Check Timeout settings, DNS settings, Serial settings, SNMP settings, and Web Access settings for the ioLogik.

IP Settings

You can set up a static or dynamic IP address for the ioLogik, as well as the subnet mask and gateway address. Click **Accessible IP** if you wish to allow only certain IP addresses to have network access to the ioLogik and attached sensors. Access will be granted only to the IP addresses that you list in the Accessible IP screen. Any requests from sources that are not on the accessible IP list will be unable to use Modbus/TCP or ioAdmin to access the ioLogik.

Modbus/TCP Alive Check Timeout Settings

The Modbus/TCP Alive Check Timeout is designed to avoid TCP connection failure. If the network host is unable to respond due to hardware failure or a network problem, the ioLogik will continue to wait for a response from the host. This will cause the TCP port to be occupied indefinitely by the host. When **Modbus/TCP idle connection timeout interval** is enabled, the ioLogik will automatically close the TCP connection when there is no TCP activity for the specified time.

DNS Settings

Use this field to specify up the IP addresses of one or to two DNS servers. DNS servers may be used to find available e-mail addresses when setting up Click & Go rules.

Serial Settings

You may view the reserved RS-485 communication parameters here, and you may set the timeout value for breaks in RS-485 communication. Note that the other serial communication parameters cannot be modified. If you wish to adjust the baudrate, you will need to use the physical dial on the back panel of the ioLogik.

SNMP Settings

The ioLogik E2212 provides SNMP v2 (Simple Network Management Protocol) to allow monitoring of network and I/O devices with SNMP Network Management software. It is useful for building automation and telecom applications. Use these fields to enable SNMP and set the read and write community strings.

Web Access Settings

This field enables and disables the web console, which allows the ioLogik to be configured from a web browser. If this field is not enabled, you will not be able to open the web console.

Firmware Update Tab

The **Firmware Update** tab is available after you log in as an administrator. Enter the path to the firmware file or click on the icon to browse for the file. Click **Update** to update the ioLogik firmware. The wizard will lead you through the process until the ioLogik is restarted.

ATTENTION

Do not interrupt the firmware update process! An interruption in the process may result in your device becoming unrecoverable.

After the firmware is updated, the ioLogik will restart and you will have to log in again to access administrator functions.

The firmware on any attached I/O expansion module, such as an ioLogik R2000 server, must be updated over the RS-485 bus. Firmware on cascaded modules cannot be updated over Ethernet.

Watchdog Tab

The Watchdog tab is available after you log in as an administrator. When enabled, the Host Connection Watchdog monitors the network connection. If the connection is lost for the specified Timeout value, the Watchdog will display a warning and activate the Safe Status settings for each DO channel and Event Counter channel. By default, the Watchdog is disabled. To enable the Watchdog, make sure that Enable Host Connection Watchdog is checked, set the Timeout value, and click Update.

After the Watchdog is enabled, a warning will be displayed on the Watchdog tab if the network connection is lost.

After you restore the network connection, click **Clear Alarm** to reset the Watchdog and return to normal operation.

Click&Go Logic Tab

The Click&Go Logic tab is available after logging in as an administrator. This is where the ioLogik's Active Ethernet I/O system is configured. With a set of rules (known as a ruleset) defined through Click&Go, the ioLogik can report I/O status to a host as soon as user-defined I/O conditions have been met. Please refer to Chapter 5 for more detailed information on defining rules.

Changes in the Click&Go Logic tab are not effective until the ioLogik E2212 is restarted, just like changes made in other tabs. After logging back in as an administrator and returning to the Click&Go Logic tab, click **Download** to view the current ruleset. Click **Run** to activate the ruleset and **Stop** to deactivate it.

When a DI or DO channel is used in a Click&Go Logic rules, the channel's range and units will become fixed and may not be modified.

Server Context Menu

The Server context menu is accessed by right clicking on the server model name in the navigation panel.

Connect

Select this command to try connecting over the network to the selected ioLogik.

Disconnect

Select this command to drop the network connection with the selected ioLogik.

Delete I/O Server

Select this command to remove the selected ioLogik.

Add Serial I/O Server

Select this command to add an ioLogik I/O server by specifying its Unit ID.

Restart System

Select this command to restart the selected ioLogik. You will need to be logged in as an administrator to use this command.

Reset to Default

Select this command to reset all settings on the selected ioLogik, including console password, to factory default values. You will need to be logged in as an administrator to use this command.

Export System Config

Select this command to export the selected ioLogik's configuration to a text file. You will need to be logged in as an administrator to use this command. It is strongly recommended you use this method to back up your configuration after you have finished configuring the ioLogik for your application.

The following is a sample configuration file:

```
ioLogik E2212 Network I/O Server Configuration
Date: 2007/5/21
Time: PM 04:05:39
Firmware: V1.0 Build07050112
 [1. Model]

                                                                           D082_PWN=0,(0ff),
D083_PWN=0,(0ff),
D084_PWN=0,(0ff),
D085_PWN=0,(0ff),
```

Import System Config

Select this command to load a configuration for the selected ioLogik from a configuration text file. You will need to be logged in as an administrator to use this command. The new configuration will not take effect until the ioLogik has been restarted. This command may be used to restore a configuration after loading the factory defaults, or to duplicate a configuration to multiple ioLogik units.

Using TFTP to Import/Export Configuration

TFTP (Trivial File Transfer Protocol) was defined in 1980 to provide basic FTP functionality in a very simple protocol. Due to TFTP's simplicity, it can be implemented using a very small amount of memory, an important consideration when it was first developed. ioLogik E2000 I/O servers support the use of TFTP to import or export configuration files.

The following is an example using Windows TFTP and an ioLogik E2212 with an IP address of 192.168.127.254:

- 1. Enter "TFTP 192.168.127.254 GET ik2212.txt" to get the ioLogik's configuration file.
- 2. Enter "TFTP 192.168.127.254 PUT ik2212.txt" to load a configuration file onto the ioLogik

You must use "**ik2212.txt**" as the destination filename when copying a configuration file to the ioLogik E2000 unit. Otherwise, you will receive an error message as shown below:

```
Error on server : ioServer - Fail to write file !!cess Protocol
pcmail-srv
                   158/tcp
                                                        #PCMail Server
                   161/udp
                                                        #SNMP
snmp
snmptrap
                   162/udp
                               snmp-trap
                                                        #SNMP trap

                   170/tcp
                                                        #Network PostScript
                   179/tcp
                                                        #Border Gateway Protocol
ogp
                   194/tcp
                                                        #Internet Relay Chat Protoco
                   213/udp
                                                        #IPX over IP
                   389/tcp
                                                        #Lightweight Directory Acces
dap
s Protocol
                   443/tcp
                               MCom
nttps
                   443/udp
                               MCo
nttps
                   443/tcp
                               MCom
nttps
                               MCo?<sub>□</sub>
                   443/udp
ttps
```

You can use TFTP in a batch file to transfer configuration files for different units. For example, you might have two configuration files that need to be copied to two different servers: **ik2212_1.txt** for 192.168.127.253, and **ik2212_2.txt** for 192.168.127.254. A batch file could be written as follows:

tftp 192.168.127.253 put ik2212_1.txt ik2212.txt

tftp 192.168.127.254 put ik2212_2.txt ik2212.txt

ATTENTION

You can also run TFTP client software, open the configuration file, and enter the remote server's IP. Note that both ASCII and Octet mode are supported. When the download process is complete, the I/O server will reboot.

WinTFTP Client Pro is a trademark of WinTFTP. All rights reserved.

Using ioEventLog

Installing ioEventLog

ioEventLog is a Windows utility provided for the monitoring of the ioLogik E2212 and attached I/O devices. It may be used from anywhere on the network to monitor the ioLogik E2212.

- 1. **Installation from CD:** Insert the Document and Software CD into the host computer. Run SETUP.EXE, which is located in the root directory. The installation program will guide you through the installation process and install the ioEventLog utility.
- 2. **Open ioEventLog:** After installation is finished, run ioEventLog from **Start** → **Program** Files → Moxa → IO Server → Utility → ioEventLog.

Basic Functions

ioEventLog is installed along with ioAdmin form the Document and Software CD. It is designed to help you keep a record of ioLogik status events over the network. The log is stored on the Windows PC. You will need to set up your ioLogik server to send status events to the PC's IP address. The following events are monitored:

- cold start
- warm start

For each event, the following information is provided. The log can be sorted by any of these fields:

- event type
- event date and time
- ioLogik server source name
- source IP
- destination IP
- host date and time
- source model

Configuration

In the System menu, select **Settings** to configure ioEventLog.

The **Alarm Listen Port** is the TCP port number that will be monitored for status events. You can modify this setting as necessary to receive signals through a firewall. It will need to match the settings for the ioLogik server that is being monitored.

The **Log Directory** is where the log files will be stored. The default directory is C:\Program Files\Moxa\ioEventLog\log. A separate log file is created for each day, with file names assigned automatically.

You can also select the color of each event type in the log.

Checking Connected Devices

You can see which I/O servers are already connected to ioEventLog by selecting **Connected Device List** from the **Connection** menu. You will be prompted to view which devices are connected.

Opening Log Files

You can view previously saved logs by selecting **Open** from the Log menu. You will be prompted for the data that you wish to view.

The logs for the day that you select will be displayed in the Alarm Log Viewer window.

Clearing the Log

If you wish to clear the log, you can select Clear from Log menu. This will clear all events for the current day. The cleared events will not be saved in that day's logs. After the logs are cleared, new events will be displayed and recorded as usual.

Web Console Configuration

The ioLogik E2212's built in web console can be used to configure many of the ioLogik's settings. The following topics are covered:

- ☐ Introduction to the Web Console
- **□** Basic Settings
- **□** Network Settings
 - General Settings
 - **Ethernet Configurations**
 - ➤ RS-485 Settings
- ☐ I/O Settings
 - DI Channels
 - DO Channels
- **□** System Management
 - ➤ Accessible IP Settings
 - ➤ SNMP Agent
 - ➤ Network Connection
 - > Firmware Update
 - ➤ Import System Config
 - > Export System Config
 - > LCM
 - Change Password
 - Load Factory Default
 - > Save/Restart

Introduction to the Web Console

The ioLogik web console is a browser-based configuration utility. When the ioLogik is connected to your network, you may enter the server's IP address in your web browser to access the web console. Note that although most configuration options are available in the web console, some settings are only available through ioAdmin. Furthermore, the web console can be disabled under Web Access Settings in ioAdmin. If you are unable to access the web console, check the Web Access Settings in ioAdmin.

The left panel is the navigation panel and contains an expandable menu tree for navigating among the various settings and categories. When you click on a menu item in the navigation panel, the main window will display the corresponding options for that item. Configuration changes can then be made in the main window. For example, if you click **Basic Settings** in the navigation panel, the main window will show a page of basic settings that you can configure.

You must click **Submit** after making configuration changes. The Submit button will be located at the bottom of every page that has configurable settings. If you navigate to another page without clicking the Submit button, your changes will not be retained.

Submitted changes will not take effect until they are saved and the ioLogik is restarted! You may save and restart the server in one step by clicking on the Save/Restart button after you submit a change. If you need to make several changes before restarting, you may save your changes without restarting by selecting Save/Restart in the navigation panel. If you restart the ioLogik without saving your configuration, the ioLogik will discard all submitted changes.

Basic Settings

On the **Basic Settings** page, you may set the ioLogik's system time or provide the IP address of a time server for time synchronization.

Network Settings

General Settings

On the **General Settings** page, you may assign a server name and location to assist you in differentiating between different I/O servers. You may also enable the Host Communication Watchdog and define the timeout value.

When enabled, the **communication watchdog** monitors the network connection. If the connection is lost for the specified number of seconds, the watchdog will activate the Safe Status settings for each DO channel and Event Counter channel. By default, the watchdog is disabled. To enable the Watchdog, select **Enable communication watchdog** and set the timeout value.

Ethernet Configurations

On the **Ethernet Configurations** page, you may set up a static or dynamic IP address for the ioLogik, as well as the subnet mask and gateway address.

RS-485 Settings

On the **RS-485 Settings** page, you may view the serial communication parameters, but no configuration changes are allowed. The baudrate can only be configured using the physical dial on the back of the unit. This is a reserved function.

I/O Settings

You can view the settings for DI and DO channels in the web console. DIO channels will be listed according to the configured channel type (DI or DO). The DIO channel type can only be changed using ioAdmin and cannot be changed from within the web console. Please refer to Chapter 3 for additional information on using ioAdmin.

DI Channels

On the **DI Channels** page, you may view the status of each DI (digital input) channel. Both fixed DI channels and DIO channels that are acting as DI channels will be displayed.

You may click on a channel for that channel's configuration options. DI channels can operate in DI mode or Event Counter mode. Software filtering is used to control switch bounces. The filter is configurable in multiples of 0.5 ms and accepts values between 1 and 65535. For example, a setting of 2 would mean a 1 ms filter (2×0.5 ms). For Event Counter channels, make sure that the filter is not set to 0, otherwise the counter will never be activated.

A DI channel can be set to "DI" or "Event Counter" mode. In DI mode, the specifications are as follows:

| Type | Logic 0 (OFF) | Logic 1 (ON) | |
|-------------|---------------|--------------|--|
| Dry contact | close to GND | open | |
| Wet contact | 0 to 3 V | 10 to 30 V | |

In Event Counter mode, the channel accepts limit or proximity switches and counts events according to the ON/OFF status. When "Lo to Hi" is selected, the counter value increases when the attached switch is pushed. When "Hi to Lo" is selected, the counter value increases when the switch is pushed and released.

By default, the Event Counter value will be reset to zero if power is disconnected. If you select **Save Status on Power Failure**, the Event Counter value will be saved when power is disconnected. When power is reconnected, the value will be as you left it. You can set **Power On Setting** to have counting resume immediately.

DI channels that are in Event Counter mode can begin counting automatically when the ioLogik is powered on. To activate this function, enable **Power On Setting**. If **Power On Setting** is not enabled, the channel will only start counting events when specified by a Modbus command or Click&Go Logic rule.

You can control how an Event Counter channel behaves during a network disconnection with the **Safe Status Setting** and the Host Connection Watchdog. With the Watchdog disabled, the Event Counter continues counting events even when there is a network disconnection. With the Watchdog enabled, the **Safe Status Setting** specifies whether the Event Counter continues or suspends counting when there is a network disconnection. Counting will continue if **Safe Status Setting** is enabled; counting will be suspended if **Safe Status Setting** is not enabled.

DO Channels

On the **DO Channels** page, you may view the status of each DO (digital output) channel. Both fixed DO channels and DIO channels that are acting as DO channels will be displayed.

You may click on a channel for that channel's configuration options. DO Channels can operate in DO mode or Pulse Output mode. In DO mode, output is either on or off. In Pulse Output mode, a configurable square wave is generated.

By default, DO and Pulse Output channels are set to "off" when the ioLogik is powered on. You can set a channel to automatically turn on or begin pulse output when the ioLogik is powered on, by enabling **Power On Setting.**

You can control how a DO or Pulse Output channel behaves during a network disconnection with the **Safe Status Setting** and the Host Connection Watchdog. With the Watchdog disabled, there is no change to the channel's status when there is a network disconnection. With the Watchdog enabled, the **Safe Status Setting** determines whether the channel will turn off, on, or begin pulse output when there is a network disconnection. The channel will turn on or begin pulse output if **Safe Status Setting** is enabled; the channel will turn off if **Safe Status Setting** is not enabled.

System Management

Accessible IP Settings

On the **Accessible IP Settings** page, you may control network access to the ioLogik by allowing only specified IP addresses. When the accessible IP list is enabled, a host's IP address must be listed in order to have access to the ioLogik.

You may add a specific address or range of addresses by using a combination of IP address and netmask, as follows:

- To allow access to a specific IP address

 Enter the IP address in the corresponding field; enter 255.255.255 for the netmask
- To allow access to hosts on a specific subnet
 For both the IP address and netmask, use 0 for the last digit (e.g., 192.168.1.0 and 255.255.255.0).
- To allow unrestricted access

 Deselect the Enable the accessible IP list option.

The following table shows additional configuration examples.

| Allowed Hosts | IP address | Netmask |
|--------------------------------|---------------|-----------------|
| Any host | Disable | Disable |
| 192.168.1.120 | 192.168.1.120 | 255.255.255.255 |
| 192.168.1.1 to 192.168.1.254 | 192.168.1.0 | 255.255.255.0 |
| 192.168.0.1 to 192.168.255.254 | 192.168.0.0 | 255.255.0.0 |
| 192.168.1.1 to 192.168.1.126 | 192.168.1.0 | 255.255.255.128 |
| 192.168.1.129 to 192.168.1.254 | 192.168.1.128 | 255.255.255.128 |

SNMP Agent

On the **SNMP Agent** page, you may enable SNMP and set the read and write community strings. The ioLogik provides SNMP v2 (Simple Network Management Protocol) to allow monitoring of network and I/O devices with SNMP Network Management software. This is useful for building automation and telecom applications.

Network Connection

On the **Network Connection** page, you may view the TCP connections from other hosts. This may assist you in the management of your devices.

Firmware Update

On the **Firmware Update** page, you may load new or updated firmware onto the ioLogik.

Import System Config

On the **Import System Config** page, you may import a configuration onto the ioLogik server. The configuration file can be generated by ioAdmin or through the web console. This function can be used to duplicate settings between ioLogik servers. You will be prompted for the location of the configuration file (i.e., "ik2212.txt").

Export System Config

On the **Export System Config** page, you may save the ioLogik's configuration into a file for backup or import into another ioLogik server.

LCM

If you have installed the optional LCM, you may view the status and firmware details on the LCM page.

Change Password

For all changes to the ioLogik E2212's password protection settings, you will first need to enter the old password. Leave this blank if you are setting up password protection for the first time. To set up a new password or change the existing password, enter your desired password under both **New password** and **Confirm password**. To remove password protection, leave **New password** and **Confirm password** blank.

ATTENTION

If you forget the password, the ONLY way to configure the **ioLogik** is by using the reset button to load the factory defaults.

Before you set a password for the first time, it is a good idea to export the configuration to a file when you have finished setting up your ioLogik. Your configuration can then be easily imported back into the ioLogik. This will be useful if the ioLogik has been reset to factory defaults due to a forgotten password or for other reasons.

Load Factory Default

This function will reset the ioLogik to factory default settings. All previous settings including the console password will be lost.

Save/Restart

If you change the configuration, do not forget to reboot the system.

Click&Go Logic

Click&Go Logic was developed by Moxa to provide an easy way to program your ioLogik E2212 for Active Ethernet I/O operation. In this chapter, we will show you how Click&Go Logic works and how to use it to develop your Active Ethernet I/O system.

The following topics are covered in this chapter:

| ш (|)verv | iev |
|-----|-------|-----|

□ Features

☐ Click&Go Logic Basics

➤ Working with Rules

□ Defining Logic Rules

- ➤ IF Conditions
- More Info on Repeat Interval vs. Edge Detection
- > THEN Actions

□ Defining Peer-to-Peer I/O Rules

- Configuring Input Module
- Configuring Output Module

□ Working with Click&Go Rulesets

- > Activating the Ruleset
- Ruleset Management Bar
- Ruleset Import/Export

□ Application Examples

- ➤ Local I/O Control
- ➤ Active I/O Messages
- ➤ Peer-to-Peer I/O

Overview

The ioLogik E2212's Active Ethernet I/O system eliminates the need for host computers to continually poll I/O devices for status. Instead, the server itself is able to monitors the status of each I/O device and take the appropriate action when the I/O status satisfies a user-defined condition. For example, the ioLogik E2212 could be configured to send a TCP/UDP message only when the switch attached to DI-0 is turned on. This structure results in a much improved response time and a much reduced load on the host computer's CPU and on network bandwidth.

The Active Ethernet I/O system is easily configured using Moxa's Click&Go Logic. With Click&Go Logic, you can easily and intuitively configure when and how I/O information is transmitted over the network. Simple If – Then statements are used to specify conditions that are required for certain actions to take place. Up to three conditions and three actions can be combined in a rule, and you may define up to 16 rules. Supported actions include sending SNMP traps or TCP/UDP messages to up to 10 hosts at a time.

Click&Go can also be used to map an input channel on one ioLogik E2212 to an output channel on another ioLogik E2212, for peer-to-peer I/O communication. Up to five different IP addresses can be entered as the output destination. Peer-to-peer I/O provides a very flexible and easy way to extend I/O signals or connect remote on/off switches. It can be used, for example, to replace or extend the wiring of PLC or DCS systems over Ethernet.

Features

Click&Go Logic's key features are as follows:

- Easy local logic control using intuitive IF/THEN style construction
- Up to 16 user-defined rules
- Up to 3 I/O-based conditions and 3 DO or network actions per rule
- Choice of email, TCP, UDP, or SNMP trap for active I/O messaging
- Customizable message content with dynamic fields for time, date, IP address, and more
- Up to 10 simultaneous IP destinations for TCP/UDP messaging
- Up to 5 simultaneous IP destinations for peer-to-peer I/O
- Configurable interval for time-triggered events

Click&Go Logic Basics

To use Click&Go Logic, open ioAdmin and log on as an administrator on the Server Settings tab. Once you are logged on, go to the Click&Go Logic tab. It should appear as below:

Click&Go Logic Tab

- 1. Logic Name: In this field, you may assign a name for the set of rules.
- 2. Rules List: In this area, each rule's conditions, actions, and status are displayed.
- 3. Ruleset Management Bar: In this area, you manage the ruleset.

Working with Rules

Rules are the building blocks of your Active Ethernet I/O system. With rules, you define the exact trigger conditions for transmission of I/O information as well as the content and destination of that information. DO operation can also be automated through DI trigger conditions or mapped directly to a remote DI channel on another ioLogik E2212.

In the main screen, you will see a list of the rules in the current ruleset. Double click on a rule to open that rule's configuration window, or double click on an empty rule to start a new rule.

The configuration window is where the rule is defined. There are two types of rules that can be defined: Logic rules and peer-to-peer I/O rules. Logic rules are used for DI event-based triggers, whereas peer-to-peer I/O rules are used for mapping I/O channels between two ioLogik E2212 units.

The **Equivalent Logic Statement** at the bottom shows a real-time text-based summary of the rule that you are defining. It can be a useful way to make sure that the rule is designed as you intended.

ATTENTION

When configuring input or output control or response values, **you must select the unit of measurement before entering a value**. If you select a unit of measurement after entering a value, the value will not be retained. Also, when an I/O channel is being used in a Click&Go Logic rule, the channel's range and units may not be modified.

Defining Logic Rules

IF Conditions

Under the **IF** column, you may set up to 3 sensor conditions that must be satisfied for the actions under the **THEN** column to take place. As soon as the IF conditions are satisfied, the specified THEN action is performed. For example, an alarm can be activated when a door is opened. Use the pull downs to specify the conditions and units of measurement (e.g. DI-0=OFF). The available operators are =, <, >, <=, and >=.

Edge detection can be used to refine the conditions. For example, the condition **DI-0=OFF** is satisfied for as long as DI-0 remains off. The condition **DI-0=ON** to **OFF**, however, is only satisfied only at the instant that DI-0 turns off.

You may want an action to be repeated for as long as the conditions remain satisfied. For example, instead of turning on an alarm, you may wish to send an alert message every five minutes for as long as the door is open. You can set a repeating interval in the **Check every ____ sec** field. The THEN action will be repeated at the specified interval, as long as the set of IF conditions is satisfied. Note that if edge detection is used in the IF conditions, the **Check every ____ sec** field will be of no use, because edge-detection conditions can only satisfied for an instant rather than over a sustained period of time. More information is provided below.

Under **Relation between conditions**, select **AND** to specify that all conditions must satisfied for the actions to take place; select **OR** to specify that any one of the conditions may be satisfied for the actions to take place.

You may wish to set up a heartbeat status message or action that repeats at regular intervals as long as the I/O server is operational. In this case, you can set up a **Time Trigger** rule as the first IF condition. For example, you can set a 3600 second interval so that a TCP status message is sent every hour. When using Time Trigger with pulse output, make sure that trigger interval is at least one second greater than the output pulse cycle.

| IF Conditions | Operators | Remark |
|--|----------------------------------|--|
| DI-x | ON, OFF, ON to OFF, OFF to ON | Depends on DI type |
| Counter-x | =,>,<,>=,<=,Change | Max value 4,294,967,295 |
| Time Trigger (Condition #1 only) | N/A | Max value 4,294,967,295 for time interval |

More Info on Repeat Interval vs. Edge Detection

The **Check every** ____ **sec** field is designed to allow THEN actions to be repeated when the specified conditions are sustained. However, if a condition is based on edge detection (i.e., **ON to OFF** or **OFF to ON**), it cannot be sustained, and the **Check every** ____ **sec** field will have no effect.

The following scenarios illustrate how edge detection affects the **Check every** ____ **sec** field. In each diagram, the statuses of three sensors are shown over a period of time, with a high signal corresponding to a "true" condition. The green shaded area shows the duration of time that the IF conditions have been met.

No Edge Detection

In this scenario, the rule checks each sensor for "on" status, so edge detection is not involved. As long as the sensors remain on, the required conditions are satisfied, and the THEN actions will repeat at interval *N*.

Edge Detection for All Conditions

In this scenario, the rule checks each sensor for a change from "off" to "on" status, meaning only edge detection conditions are used. As soon as a sensor changes from "off" to "on", the condition is satisfied, but only for that instant. Right after that instant, the condition is no longer satisfied because it is no longer changing from "off" to "on". The repeat interval will have no effect, since edge conditions cannot be sustained over a period of time.

Edge Detection for Two Conditions

In this scenario, the rule checks DI-0 and DI-1 for a change in status and DI-2 for status only. The repeat interval will not have an effect if the AND relationship is used, because the two edge conditions can never be sustained over a length of time. With the OR relationship, the IF conditions will be satisfied as long as DI-2 is "on", and the THEN actions will be triggered over interval *N*.

Edge Detection for One Condition

In this scenario, the rule checks DI-0 for a change in status and DI-1 and DI-2 for status only. The repeat interval will not have an effect if the AND relationship is used, because the edge condition for DI-0 can never be sustained over a length of time. With the OR relationship, the IF conditions will be satisfied as long as DI-1 or DI-2 is "on", and the THEN actions will be triggered over interval *N*.

THEN Actions

Under the **THEN** column, you may specify up to 3 actions that will be performed when the conditions under the **IF** column are satisfied. Possible actions include changing the status of a DO channel, starting or stopping an Event Counter, or sending a message by SNMP trap, TCP, UDP, or e-mail. For message transmission, click the memo icon () to configure additional message parameters.

| THEN Actions | Operators | Remark |
|------------------------|------------|--------------------|
| Counter-x | Reset | Depends on DI type |
| DO-x | ON/OFF | Depends on DO type |
| Pulse Output- <i>x</i> | Start/Stop | Depends on DO type |
| SNMP Trap | 1 to 20 | Details below |
| Active Message | N/A | Details below |
| Email | N/A | Details below |

Active Message

The **Active Message** option sends a customized message to one or more IP destinations by TCP or UDP. Click the memo icon to configure the message and parameters. When a message has been triggered, you may view the outgoing message in the Message Monitor tab. In the Message Monitor tab, you may view messages in HEX by selecting **Toggle HEX**.

After clicking the memo icon, enter your desired message in the **Message Content** window. You may select TCP or UDP as the messaging protocol, but you must use the same protocol for all Click&Go Logic rules. Dynamic fields such as time, date, IP address, and I/O status may be inserted in your message by clicking **Keyword Lookup**. Up to 10 recipients can be specified in the **Message Receiver list**. The **Message Port** is set to 9000 by default and can be modified as necessary to work with your firewall. Messages are sent in ASCII by default, but can be sent in HEX by selecting **Send as HEX**.

When sending a message in HEX, each HEX value must be delimited by commas. Note that certain numbers are control characters that will not show up in the Message Monitor, as shown in the following example:

SNMP trap

The **SNMP trap** option sends an SNMP trap to one or more IP destinations. You may select a trap number between 1 and 20. (You may need to consult with your network administrator to determine how trap numbers will be used and defined in your network.) Click the memo icon to specify up to 10 recipients for the SNMP trap. You can also bind the status of up to three I/O channels within each trap.

E-mail

The **E-mail** option sends a customizable e-mail to one or more e-mail addresses. Click the memo icon to configure the message and parameters.

Enter the message content in the **Mail Content** area. Dynamic fields such as time, date, IP address, and I/O status may be inserted in your message by clicking **Keyword Lookup**.

If you provided SMTP server information, the **Available receiver(s) list** should contain a list of available e-mail addresses for your network environment. Specify the recipients of the e-mail message by using the finger icons to move addresses to and from the **Receiver(s) list**. The e-mail message will be sent to all addresses listed in the **Receiver(s) list**. You may modify an e-mail address by clicking the memo icon.

To manually add e-mail addresses to the **Available receiver(s) list**, enter the **Name** and **Mail Address** and click **Add**. Once the address has been added to the **Available receiver(s) list**, use the finger icons to move it to or from the **Receiver(s) list**.

In the From Address, enter the e-mail address that recipients will see in the e-mail's From field.

Under Mail Server Settings, you must configure the IP address of the SMTP server with your username and password.

Defining Peer-to-Peer I/O Rules

A basic use of digital input and output is to connect a pushbutton to an LED. The pushbutton is the digital input, with on/off status controlled by a user, and the LED is the digital output, with on/off status controlled by the button. With peer-to-peer I/O on the ioLogik E2212, this operation is mapped over Ethernet from a DI channel on one ioLogik E2212 to the DO channel on another ioLogik E2212. Peer-to-peer I/O makes it easy for a pushbutton to have direct control of an LED in another room, building, or even city.

The ioLogik supports peer-to-peer I/O for simple one-to-one mapping as well as one-to-many and many-to-many mapping. A single DI channel can be mapped to up to five remote DO channels.

Peer-to-peer I/O is configured in two steps. On the input module, a Click&Go Logic rule is defined to stream a DI channel's signals to one or more output modules. On the output module, a Click&Go Logic rule is defined to receive an input module's DI channel signals and mirror them on a DO channel.

Configuring Input Module

The peer-to-peer I/O input module is configured using a single Click&Go rule. In the Click&Go tab, start a new rule, select **Enable peer-to-peer I/O**, and then select **Input channels mirror to**. Click **remote IP...** and enter up to five IP addresses as destinations. Each IP address should belong to an ioLogik E2212 unit that will act as an output module for peer-to-peer I/O operation. If you wish, you may set up additional peer-to-peer I/O rules in order to mirror input channels to more than five destinations. If all 16 rules are used for peer-to-peer I/O, a total of 80 destination IP addresses can be entered.

Only DI channels that are set to DI mode can be mirrored on the output module. Peer-to-peer I/O will not function with Event Counter channels.

The ioLogik E2212 can simultaneously act as both an input module and an output module. Input module operation would be configured in one rule, and another rule would be used to configure output module operation.

Configuring Output Module

The peer-to-peer I/O output module is configured using one Click&Go rule for each DO channel that is mirroring a remote DI channel. In the Click&Go tab, start a new rule, select **Enable peer-to-peer I/O**, and then select **Output channel**. Specify the DO channel that will mirror the remote input channel, the IP address of the input module, and the DI channel on the input module whose signals will be mirrored. The input module must have specified the output module's IP address as a destination IP.

When properly configured, the specified DO channel will mirror the signals received by the specified remote DI channel, as if the channels were physically connected. If the remote DI channel's status changes to "on", the specified DO channel's status will change to "on". If the remote DI channel's status changes to "off", the DO channel's status will change to "off".

Only DO channels that are set to DO mode can mirror remote DI channels. Pulse Mode channels cannot be used for peer-to-peer I/O operation.

Once both the input and output modules have been configured, start peer-to-peer I/O operation by activating the rulesets on both units and providing a valid network connection to each unit.

Working with Click&Go Rulesets

Activating the Ruleset

The rules that are displayed in the Click&Go Logic tab comprise the current ruleset, which acts as the brain of your Active Ethernet I/O system. The ruleset must be activated for the ioLogik to commence Active Ethernet I/O operation, as follows:

- 1. The ruleset must first be downloaded from ioAdmin onto the ioLogik E2212. You may do so by clicking **Download** in the Ruleset Management bar.
- After the ruleset has been downloaded, you must restart the ioLogik E2212. You may do this by
 right clicking on the server name in the navigation panel in ioAdmin and selecting **Restart**. Do
 not use the reset button, as that will load all factory defaults and erase your ruleset from
 memory.
- 3. After the ioLogik E2212 has restarted, the ruleset must be activated. After logging into ioAdmin as an administrator, go to the Click&Go Logic tab and click **Run** in the Ruleset Management bar. The rules in the ruleset will now be active.

When the ruleset has been activated, it will remain active even when the ioLogik is disconnected from the host computer or from the network. If the ioLogik is turned off, Active Ethernet I/O operation will resume when it is turned back on. This allows you to use the ioLogik E2212 for PC-independent automation.

Ruleset Management Bar

- Clear: This erases the ruleset in both ioAdmin and the ioLogik E2212.
- **Retrieve:** This copies the ruleset from the ioLogik E2212 into ioAdmin.
- **Download:** The copies the ruleset from ioAdmin onto the ioLogik E2212.
- **Run:** This activates the ruleset that the ioLogik booted up with.
- **Stop:** This de-activates the Click&Go ruleset and returns the ioLogik to normal, passive operation.

Ruleset Import/Export

The ioLogik's system configuration may be imported and exported. This configuration includes the current ruleset. As you make changes to a ruleset, you may export the system configuration in order to save that ruleset.

Application Examples

Local I/O Control

In this scenario, we have two switches, one attached to DI-0 and one attached to DO-0. Very simply, we want DO-0 to automatically mirror DI-0's setting. Once the ruleset is downloaded onto the ioLogik E2212 and activated, the server handles all processing locally and there is no usage of network or host resources.

Rule 0: IF DI-0=ON, THEN DO-0=ON

Rule 1: IF DI-0=OFF, THEN DO-0=OFF.

- In ioAdmin, make sure that you have logged in on the Server Settings tab. Go to the Click&Go Logic tab.
- 2. Double click #0 in the **Rules List**. The rule configuration window will appear.
- 3. Make sure that **Enable** in the upper left hand corner is checked.

- 4. Select Enable Logic.
- 5. Select **DI-0** as your condition in the first **IF field**, and set its value to **ON**.
- 6. Select **DO-0** as your action in the first **THEN field**, and set its value **ON**.
- 7. Click OK.
- 8. Double click on #1 in the Rules List.
- 9. Make sure that **Enable** in the upper left hand corner is checked.
- 10. Select Enable Logic.
- 11. Select **DI-0** as your condition in the first **IF field**, and set its value to **OFF**.
- 12. Select **DO-0** as your action in the first **THEN field**, and set its value **OFF**.
- 13. Click **OK**.
- 14. Click Download on the Ruleset Management Bar.
- 15. Select Yes when asked to restart and wait until the ioLogik has restarted and is back on-line.
- 16. Log in on the Server Settings tab, then go to the Click&Go Logic tab.
- 17. Click **Run** on the Ruleset Management Bar. The RDY LED will be flashing green, showing that the ioLogik is now operating as an Active Ethernet I/O server, using the ruleset that was just defined.

Active I/O Messages

In this scenario, we have a switch attached to DI-0. We want the server to send a TCP message that indicates the exact time that the switch is turned on.

Rule 0: IF DI-0=ON, THEN Message

- In ioAdmin, make sure that you have logged in on the Server Settings tab. Go to the Click&Go Logic tab.
- 2. Double click #0 in the **Rules List**. The rule configuration window will appear.
- 3. Make sure that **Enable** in the upper left hand corner is checked.
- 4. Select Enable Logic.
- 5. Select **DI-0** as your condition in the first **IF field**, and set its value to **ON**.
- 6. Select Active Message as your action in the first THEN field.
- 7. Click the memo button. The Message parameters window will appear.
- 8. Click **Keyword Lookup**. In the Variable List that pops up, click **Server_time>**.
- 9. Click Save.
- 10. Click **Download** on the **Ruleset Management Bar**.
- 11. Select Yes when asked to restart and wait until the server has restarted and is back on-line.
- 12. Log in on the Server Settings tab, then go to the Click&Go Logic tab.
- 13. Click **Run** on the Ruleset Management Bar. The RDY LED will be flashing green, showing that the ioLogik is now operating as an Active Ethernet I/O server, using the ruleset that was just defined.

Peer-to-Peer I/O

In this scenario, we are using peer-to-peer I/O to replace 2 km of I/O wiring between a control panel and a water tank.

Input Module (192.168.127.154)

Rule 0: Send I/O status to 192.168.127.3

- 1. In ioAdmin, make sure that you have searched for and selected the correct ioLogik E2212 server, at IP address 192.168.127.154. Also, make sure you are logged in on the **Server Settings** tab. Go to the **Click&Go Logic** tab.
- 2. Double click #0 in the Rules List. The rule configuration window will appear.
- 3. Make sure that **Enable** in the upper left hand corner is checked.
- 4. Select Enable peer-to-peer I/O.
- 5. Select Input channels mirror to and click remote IP...
- 6. In the 1. Dest. IP: field, enter 192.168.127.3 and click OK to save this setting.
- 7. Click **OK** to finish configuring the rule.
- 8. Click **Download** on the Ruleset Management Bar.
- 9. Select Yes when asked to restart and wait until the server has restarted and is back on-line.
- 10. Log in on the Server Settings tab, then go to the Click&Go Logic tab.
- 11. Click **Run** on the Ruleset Management Bar. The RDY LED will be flashing green, showing that the ioLogik is now operating as an Active Ethernet I/O server, using the ruleset that was just defined.

Output Module (192.168.127.3)

Rule 0: DI-0 at 192.168.127.154 mapped to DO-0

Rule 1: DI-1 at 192.168.127.154 mapped to DO-1

- In ioAdmin, make sure that you have searched for and selected the correct ioLogik E2212 server, at IP address 192.168.127.3. Also, make sure you are logged in on the Server Settings tab. Go to the Click&Go Logic tab.
- 2. Double click #0 in the **Rules List**. The rule configuration window will appear.
- 3. Make sure that **Enable** in the upper left hand corner is checked.
- 4. Select Enable peer-to-peer I/O.
- 5. Select **Output channel**, then select **DO-0** for the first field, enter **192.168.127.154** for the second field, and select **DI-0** for the third field.
- 6. Click **OK** to finish configuring the rule.
- 7. Double click #1 in the **Rules List**. The rule configuration window will appear.
- 8. Make sure that **Enable** in the upper left hand corner is checked.
- 9. Select Enable peer-to-peer I/O.
- 10. Select **Output channel**, then select **DO-1** for the first field, enter **192.168.127.154** for the second field, and select **DI-1** for the third field.
- 11. Click **OK** to finish configuring the rule.
- 12. Click **Download** on the Ruleset Management Bar.
- 13. Select Yes when asked to restart and wait until the server has restarted and is back on-line.
- 14. Log in on the Server Settings tab, then go to the Click&Go Logic tab.
- 15. Click **Run** on the Ruleset Management Bar. The RDY LED will be flashing green, showing that the ioLogik is now operating as an Active Ethernet I/O server, using the ruleset that was just defined.

Sensors at the water tank will connect to digital input channels at 192.168.127.154, and the digital output channels at 192.168.127.3 will connect to the control panel. As long as both ioLogik E2212's are on and connected to the network, the status of digital output channels 0 and 1 at 192.168.127.3 will be a "mirror" of input channels 0 and 1 at 192.168.127.154. Status will be updated once every 100 ms.

A

Liquid Crystal Display Module (LCM)

The ioLogik E2212 supports an optional detachable Liquid Crystal Display Module (LCM) for easier field maintenance. The LCM is hot-pluggable and can be used to configure the network settings or display other settings. When plugged in, the LCM displays the ioLogik "home page," and pressing any button takes you into the settings and configuration.

LCM Controls

The up and down buttons navigate between the current options. The right and left buttons enter and exit the submenus. The center button is used when modifying settings or restarting the server.

| Button | Function | | |
|--------|--|--|--|
| Up | go to the previous item | | |
| Down | go to the next item | | |
| Left | exit the current submenu and return to the previous menu (go up one level) | | |
| Right | enter the selected submenu (go down one level) | | |
| Center | enter/exit editing mode | | |

An "e" in the upper right hand corner of the display indicates that the parameter can be modified. Press the center button on the LCM to modify that parameter's settings.

LCM Options

| Display | Explanation / Actions | | |
|---|---|--|--|
| <iologik e2212=""></iologik> | This is the default "home page" showing the IP address. Press the down button to view the submenus. | | |
| <iologik e2212=""> server</iologik> | Enter this submenu to display information about the specific server you are viewing: • serial number • name • location • e2212 f/w ver • lcm f/w ver • model name | | |

| Display | Explanation / Actions | | |
|---|--|--|--|
| <iologik e2212=""> network</iologik> | Enter this submenu to display information and settings for the network: • ethernet link • mac address • ip mode • ip address • netmask • gateway • dns server-1 • dns server-2 | | |
| <iologik e2212=""> click&go</iologik> | Enter this submenu to display information about the Click&Go Logic ruleset currently loaded on the ioLogik: • name • status | | |
| <iologik e2212=""> serial port</iologik> | Enter this submenu to display the RS-485 cascade port settings. | | |
| <iologik e2212=""> i/o setting</iologik> | Enter this submenu to access I/O channel status. Here are examples of settings that you might see: • DI-00 [di]=off • DO-00 [pulse]=stop Press up or down to navigate through the different I/O channels without having to go back to the previous menu. | | |
| <iologik e2212=""> console</iologik> | Enter this submenu to see if the web console is enabled or disabled. | | |
| <iologik e2212=""> ping</iologik> | Select this option to enter an IP address to ping. If you get a "timeout" error, it indicates that the ioLogik cannot reach that IP address. Otherwise, the display will show the response time. | | |
| <iologik e2212=""> save/restart</iologik> | Enter this submenu to display the restart now submenu. Enter the restart now submenu to display the restart option. Press the center button to modify this option, then select "enable" to save changes and reboot the I/O server. The disable option has no effect. | | |

ATTENTION

Any configuration changes that are made through the LCM will not take effect until the ioLogik is restarted.

Modbus/TCP Address Mappings

E2212 Modbus Mapping

0xxxx Read/Write Coils (Functions 1, 5, 15)

| Reference | Address | Data Type | Description |

| 30019 | 0x0012 | 1 word | CH9 DI count value hi-byte |
| 30020 | 0x0013 | 1 word | CH9 DI count value lo-byte |
| 30021 | 0x0014 | 1 word | CH10 DI count value hi-byte |

| Reference | Address | Data Type | Description |
|-------------------|--|-----------|---|
| 30022 | 0x0015 | 1 word | CH10 DI count value lo-byte |
| 30023 | 0x0016 | 1 word | CH11 DI count value hi-byte |
| 30024 | 0x0017 | 1 word | CH11 DI count value lo-byte |
| 34097 | 0x1000 (4096) | 1 word | Vendor ID=0x1393 |
| 34098 | 0x1001 (4097) | 1 word | Unit ID (Ethernet=1) |
| 34099 | 0x1002 (4098) | 1 word | Product code=0x2212 |
| 34100 to 34119 | 0x1003 to 0x1016 (4099 to 4118) | 20 word | Vendor name string= "Moxa Technologies Inc.," Word 0 hi byte = 'M' (0x4d) Word 0 lo byte = 'o' (0x6f) Word 1 hi byte = 'x' (0x78) Word 1 lo byte = 'a' (0x61) Word 10 hi byte = 'c' Word 10 lo byte = '.' Word 11 hi byte = ',' Word 11 lo byte = '\0' String ending next byte value is 0 |
| 34120 to 34139 | 0x1017 to 0x102A (4119 to 4138) | 20 word | Product name string= "E2212Remote I/O Server" Word 0 hi byte = 'E' (0x45) Word 0 lo byte = '2' (0x32) Word 1 hi byte = '2' (0x32) Word 1 lo byte = '1' (0x31) Word 10 hi byte = 'v' Wword 10 lo byte = 'e' Word 11 hi byte = 'r' Word 11 lo byte = '\0' |
| 34140 to 34141 | 0x102B to 0x102C (4139 to 4140) | 2 word | Product serial number (decimal) |

| Reference | Address | Data Type | Description |
|----------------|--|-----------|--|
| | | | Firmware revision: |
| | 0x102D to | | Word 0 hi byte = major (A) |
| 34142 to | 0x102E | 2 word | Word 0 lo byte = minor (B) |
| 34143 | (4141 to | 2 word | Word 1 hi byte = release (C) |
| | 4142) | | Word 1 lo byte = build (D) |
| | | | Format is A.B.C.D |
| | 0-1025 | | Firmware release date |
| 2414445 | 0x102F to 0x1030 | | Example: |
| 34144 to 34145 | | 2 word | High word = 0x2005 |
| 34143 | (4143 to 4144) | | Low word = $0x1101$ |
| | 4144) | | Firmware release date is Nov. 1, 2005 |
| 34146 | 0x1031 | 1 word | Number of TCP connected, sum of Modbus/TCP & |
| 34140 | (4145) | 1 word | http |
| | 0x1032 | | Ethernet interface speed, |
| 34147 | (4146) | 1 word | 0x10 (10 Mbps) or |
| | (11.0) | | 0x100 (100 Mbps) |
| | | | Ethernet physical address (MAC-ID) |
| | | | Example: |
| | 0x1033 to | | Word 0 hi byte = 0 |
| 34148 to | 0x103310 $0x1035$ | | Word 0 lo byte = 1 |
| 34148 10 | | 3 word | Word 1 hi byte = 2 |
| 31130 | (4147 to 4149) | | Word 1 lo byte =3 |
| | 4147) | | Word 2 hi byte = 4 |
| | | | Word 2 lo byte = 5 |
| | | | MAC-ID is 00-01-02-03-04-05 |
| | 0x1036 (4150) | 1 word | LCM detect |
| 34151 | | | 0: no LCM |
| | | | 1: LCM detected |
| | | | LCM firmware revision: |
| | 0x1037 to | | Word 0 hi byte = major (A) |
| 34152 to | 1038 | 2 word | Word 0 lo byte = minor (B) |
| 34153 | (4151 to | 2 word | Word 1 hi byte = release (C) |
| | 4152) | | Word 1 lo byte = build (D) |
| | | | Format is A.B.C.D |
| | 0.1020 | | LCM firmware release date |
| 241544 | 0x1039 to 103A (4153 to 4154) | | Example: |
| 34154 to 34155 | | 2 word | Word $0 = 0x0705$ |
| 34133 | | | Word $1 = 0x2005$ |
| | | | Firmware release date is July 5, 2005 |
| 34156 | 0x103B (4155) | 1 word | Main loop count (event/sec) |
| 34157 | 0x103C (4156) | 1 word | TCP loop count (event/sec) |

| Reference | Address | Data Type | Description |
|-------------------|--|-----------|------------------------------|
| 34158 | 0x103D (4157) | 1 word | LCM loop count (event/sec) |
| 34159 to 34160 | 0x103E to 0x103F (4158 to 4159) | 2 word | System elapsed time (in sec) |
| 34161 | 0x1040 (4160) | 1 word | UART unit ID |
| 34162 to 34163 | 0x1041 to 0x1042 (4161 to 4162) | 2 word | UART baudrate |
| 34164 to 34165 | 0x1043 to 0x1044 (4163 to 4164) | 2 word | 8051 version |
| 34166 | 0x1045 (4165) | 1 word | Click&Go ready |
| 34167 to 34182 | 0x1046 to 0x1055 (4166 to 4181) | 16 word | Click&Go get input channel |
| 34183 to 34199 | 0x1056 to 0x1065 (4182 to 4198 | 16 word | Click&Go get output channel |
| 38193 to 38264 | 0x2000 (8192 to 8263) | 72 word | Sync IO input |
| 38265 to 38336 | 0x2048 (8264 to 8335) | 72 word | Sync IO output |
| 38337 to 38408 | 0x2090 (8336 to 8407) | 72 word | DI sync setting power-on |
| 38409 to 38480 | 0x20D8 (8408 to 8479) | 72 word | DO sync setting power-on |
| 38481 to 38552 | 0x2120 (8480 to 8551) | 72 word | DI sync setting safe |
| 38553 to 38624 | 0x2168 (8552 to 8623) | 72 word | DO sync setting safe |

| Reference | Address | Data Type | Description |
|-----------|------------------|-----------|-----------------------------------|
| 39473 | 0x2500 (9472) | 1word | Report E2212 DI/DO channel number |
| 39474 | 0x2501 (9473) | 1 word | Report AI/AO channel number |
| 39475 | 0x2502 (9474) | 1word | Report RTD/TC channel number |
| 312289 | 0x3000 | 1 word | CH0 DI value |
| 312290 | 0x3001 | 1 word | CH1 DI value |
| 312291 | 0x3002 | 1 word | CH2 DI value |

D

SNMP Agents with MIB II, RS-232-like Groups

RFC1213 MIB II Supported SNMP Variables

The following SNMP variables are built into the ioLogik firmware and are compliant with RFC1213 MIB II.

| System MIB | | |
|-------------|-------------|-------------|
| SysDescr | SysContact | SysServices |
| SysObjectID | SysName | |
| SysUpTime | SysLocation | |

| Interfaces MIB | | |
|----------------|-------------------|-----------------|
| ifNumber | ifOperStatus | ifOutOctets |
| ifIndex | ifLastChange | ifOutUcastPkts |
| ifDescr | ifInOctets | ifOutNUcastPkts |
| ifType | ifInUcastPkts | ifOutDiscards |
| ifMtu | ifInNUcastPkts | ifOutErrors |
| ifSpeed | ifInDiscards | ifOutQLen |
| ifPhysAddress | ifInErrors | ifSpecific |
| ifAdminStatus | ifInUnknownProtos | |

| IP MIB | | |
|-------------------|------------------|---------------------|
| ipForwarding | ipReasmFails | ipRouteNextHop |
| IpDefaultTTL | ipFragOKs | ipRouteType |
| ipInreceives | ipFragFails | ipRouteProto |
| ipInHdrErrors | ipFragCreates | ipRouteAge |
| ipInAddrErrors | ipAdEntAddr | ipRouteMask |
| ipforwDatagrams | ipAdEntIfIndex | ipRouteMetric5 |
| ipInUnknownProtos | ipAdEntNetMask | ipRouteInfo |
| ipInDiscards | ipAdEntBcastAddr | ipNetToMediaIfIndex |

| IP MIB | | |
|--------------------|---------------------|-------------------------|
| ipInDelivers | ipAdEntReasmMaxSize | ipNetToMediaPhysAddress |
| ipOutRequests | ipRouteDest | ipNetToMediaNetAddress |
| ipOutDiscards | ipRouteIfIndex | ipNetToMediaType |
| ipOutNoRoutes | ipRouteMetric1 | ipRoutingDiscards |
| ipReasmtimeout | ipRouteMetric2 | |
| ipReasmReqds | ipRouteMetric3 | |
| ipReasmOKs | ipRouteMetric4 | |
| IcmpInmsgs | IcmpIntimestamps | IcmpOutRedirects |
| IcmpInErrors | IcmpTimestampReps | IcmpOutechos |
| IcmpInDestUnreachs | IcmpInAddrMasks | IcmpOutEchoReps |
| IcmpIntimeExcds | IcmpOutMsgs | IcmpOuttimestamps |
| IcmpInParmProbs | IcmpOutErrors | IcmpOutTimestampReps |
| IcmpInSrcQuenchs | IcmpOutDestUnreachs | IcmpOutAddrMasks |
| IcmpInRedirects | IcmpOutTimeExcds | IcmpOutaddrMaskReps |
| IcmpInEchos | IcmpOutParmProbs | |
| IcmpInEchoReps | IcmpOutSrcQuenchs | |

| UDP MIB | | |
|----------------|-----------------|-----------------|
| UdpInDatagrams | UdpInErrors | UdpLocalAddress |
| UdpNoPorts | UdpOutDatagrams | UdpLocalPort |

| Address Translation MIB | | |
|-------------------------|--------------|--|
| AtIfIndex | AtNetAddress | |
| AtPhysAddress | AtNetAddress | |

| TCP MIB | | | |
|-----------------|---------------------|-------------------|--|
| tcpRtoAlgorithm | tcpEstabResets | tcpConnLocalPort | |
| tcpRtoMin | tcpCurrEstab | tcpConnremAddress | |
| tcpRtoMax | tcpInSegs | tcpConnremPort | |
| tcpMaxConn | tcpOutsegs | tcpInErrs | |
| tcpActiveOpens | tcpRetransSegs | tcpoutRsts | |
| tcpPassiveOpens | tcpconnstate | | |
| tcpAttempFails | tcpconnLocalAddress | | |

| SNMP MIB | | | |
|-------------------------|--------------------|-----------------------|--|
| snmpInPkts | snmpIngenErrs | snmpOutBadValues | |
| snmpOutPkts | nnmpInTotalReqVars | snmpOutGenErrs | |
| snmpInBadVersions | snmpIntotalSetVars | snmpOutGetRequests | |
| snmpInBadCommunityNames | snmpInGetRequests | snmpOutGetNexts | |

| snmpInASNParseErrs | snmpInSetRequests | snmpOutGetResponses | |
| snmpInTooBigs | snmpIngetResponses | snmpOutTraps | |
| snmpInNoSuchNames | snmpInTraps | snmpEnableAuthenTraps | |
| snmpInBadValues | snmpOutTooBigs | | |
| snmpInReadOnlys | snmpOutNoSuchNames | | |

Private MIB File and SNMP Variables

Moxa also provides an SNMP to I/O MIB file that can help you monitor I/O status with SNMP software. You can find the MIB file on the Document and Software CD.

| Moxa IO MIB | | |
|--------------------|-----------------|------------------|
| totalChannelNumber | DI07-Status | DO06-LowWidth |
